

Towards 2050 – Gas Infrastructure in a zero emissions economy

Because climate change is accelerating, and we don't know when tipping points for runaway self-reinforcing warming and cascading catastrophes will be crossed, and it might be already too late, every change of lifestyle to reduce carbon emissions and to increase carbon sequestration in most healthy and productive agricultural soils but be undertaken with enthusiasm and love of life.

Relocalized efficient village living and Permaculture are key to the solutions.

This can eliminate the need for gas as soon as possible and minimize investment in gas infrastructure in the near term.

This is the absolute race for humanity which will be determined well before 2050.
